Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.

Explain how the future of language programming is seen in different contexts.

Ask your partner:

- What have been the advances in language programming during the last five years?
- How do you think language programming will advance?

Can Do Statements:

- I can read about the future of language programming.
- I can write a short text to summarize my ideas about the future of language programming.
- I can explain key features related to language programming.

Let's Explore!

Ordinary people will need to deal with APIs*!

*"APIs" refers to an application programming interface.

Instructions: Read the text below.

David: Hey, Frank! How's it going?

Frank: Good, thanks. But, I'm a little bit worried because I'll publish in this magazine about the future of language programming. So, I'm reading about it to know more and do a great job.

David: I see. Let's talk about it then. What does it say?

Frank: It states that if programming developers rely on REST's simplicity, it will enhance the communications at a constant rate between producers and consumers. So, REST will prevail among others protocols.

David: I know REST is preferred over other protocol styles because it does not leverage too much bandwidth, which makes it an appropriate fit to work on the internet.

Frank: Programmers think that if they send bytes directly to the parsing process, it will be faster. This is really an upcoming change for programming innovations. Then, if JSON packets and REST provide such tighter encoding, the old world of XML data slightly disappears.

David: Wow! I will summarize this on my notepad because I think we need it as a future reference, don't you think?

Frank: Please. Also, the famous HTML5 will also open the possibilities to present video clips with HTML codes in the future.

David: What about smartphones? If we want to get real-time conditions of the roads, we simply use the Waze® app. As databases extent facilities, people will get information about the location and the source of any disturbance on the street much faster.

David: According to that rate of change, if language programming continues with such development, what will be its key features?

Frank: The innumerable programming dialects are those key features that need to be translated for a browser or the Node.js to understand them; thus transcoding robots will appear to do it automatically. Additionally, PHP will prevail for a longer period if only contributes to avoiding legal apps to be rewritten.

David: In conclusion, I would say ordinary people will eventually need to deal with APIs because an entire social system may have to communicate with thousands of code lines at the speed of light.

Let's Practice!

The Rate of Change in Language Programming

Instructions: Circle the correct option to complete the sentences.

1. People (won't need / will need) to communicate using thousands of code lines.
2. REST (won't prevailing / will prevail) among others protocols.
3. REST's simplicity (will enhance / will pass) the communications at a constant rate between producers and consumers.

Let's Practice!

Key Features of Language Programming

Instructions: Use the word(s) from the box to correctly complete the sentence.

Word Bank

will enhance / If we want / If they send / relies /
we simply use / will be.

1. _____ bytes directly to the parsing process, it _____ faster.
2. _____ to get real time conditions of the roads, _____ the Waze® app.
3. If programming developers _____ on REST's simplicity, it _____ the communications at a constant rate.

Extension Activity

Let's check programming language! ...

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about a trend application in technology.
- Identify and write down its current functions using the zero conditional.
- Make predictions about how those functions will change by the time the application continues in use.
- Organize a chart stating a condition and effect with the description of the application and the future changes of this.
- Share your chart with your instructor.

Self-Assessment

Yes No

- I search information about a famous app.
- I identify functions of an application.
- I make predictions using the future tense.
- I create a chart to present what I did.
- I share my chart with my instructor.

Target Words

- **REST** (acronym): the representation state transfer which work as an approach to communication and propose an architectural style to develop web services
e.g. So, REST will prevail among others protocols.
- **bandwidth** (noun) is the capacity rate of available or consumed information presented in a metric of bits per second
e.g. I know REST is preferred over other protocol styles because it does not leverage too much bandwidth, which makes it an appropriate fit to work on the internet.
- **parsing** (noun) syntactic analysis which checks a string of symbols in natural or computer languages
e.g. Programmers think if they send bytes directly to the parsing process, it will be faster.
- **tight** (adjective) stretched and firmly, that fits so compacted
e.g. If JSON packets and REST provide such tighter encoding, the old world of XML data slightly disappear.
- **Node.js** (noun) a cross platform environment of JavaScript that works as an open-source to develop different applications
e.g. The innumerable programming dialects are those key features that need to be translated for a browser or the Node.js to understand them.
- **deal with** (phrasal verb) to handle, to manage something
e.g. I would say ordinary people will eventually need to deal with APIs because an entire social system may have to communicate with thousands of code lines at the speed of light.

Learning Points

Zero Conditional vs First Conditional

You use two conjoined sentences as **conditionals**. One of these sentences represents a condition needed ("if clause") to influence or generate the second action ("result clause").

Zero conditional is used when you want to express only true facts and true results, while the **first conditional** implies a probability because you use it when you talk about things that might happen in the future.

Remember, the **first conditional** describes a particular situation while the **zero conditional** describes what happens in general, for example:

Zero Conditional

If you add an HTML codes, it compiles all the data.

First Conditional

If binary protocols come back, the internet of things will generate more data than ever.

Let's take a look at the structures:

Zero Conditional vs First Conditional	
Structure	Structure:
If + present simple, ...present simple + complement.	If + present simple, ...will + infinitive + complement.
Example: <i>If you work with this software every day, this means that you have to learn something different.</i>	Example: <i>If you want to learn something different, I will teach you.</i>

Examples

- *It states that if programming developers rely on REST's simplicity, it will enhance the communications at a constant rate between producers and consumers.*
- *Programmers think that if they send bytes directly to the parsing process, it will be faster.*
- *Then, if JSON packets and REST provide such tighter encoding, the old world of XML data slightly disappears.*
- *If we want to get real-time conditions of the roads, we simply use the Waze® app.*

Learning Points

The Future Tense: Will

You use **will** when you want to express expectations and hopes in regards to the future.

You use **will** as a future tense form to express a probable situation that might happen in the future. Also, when you make fast decisions and predictions based on our opinions; when you make promises or offers, and for predictable behaviors. Let's see some examples:

*Building more binary protocols **will** represent an advance in technology.*

*Once you understand the representational state transfer (REST) you **will** identify the simple object access protocol SOAP.*

Remember that you use the verb in base form after the auxiliary **will** to form the future tense.

*Language programming **will use** binary codes.*

*Developers **will enhance** codes for programming.*

You can also make contractions when using **will** and a personal pronoun. Let's see how:

Contractions	
I will	<i>I'll</i>
You will	<i>You'll</i>
He will	<i>He'll</i>
She will	<i>She'll</i>
It will	<i>It'll</i>
We will	<i>We'll</i>
They will	<i>They'll</i>

Examples

- I'm a little bit worried because I'll publish in this magazine about the future of language programming.*
- So, REST will prevail among others protocols.*
- Wow! I will summarize this on my notepad because I think we need it as a future reference, don't you think?*
- Also, the famous HTML5 will also open the possibilities to present video clips with HTML codes in the future.*

Learning Points

Understand What Subordination Is

Subordination is part of the efficiency of language to make more complex sentences. It makes part of the process of joining sentences with related ideas.

In writing, **subordination** is the process of putting together short, brief sentences with similar ideas into a longer sentence.

To make this process you use a dependent words, such as: **after, although, because** or **when**, among others. Then, in front of one independent sentence that finally, it becomes a dependent clause and it is not a complete sentence anymore.

Let's see how it happens:

TWO SENTENCES	1. <i>The use of representational state transfer REST protocol is often preferred.</i>
	2. <i>It does not leverage too much bandwidth to be used over the internet.</i>
JOINED THROUGH SUBORDINATION	<i>The use of representational state transfer protocol is often preferred because it does not leverage too much bandwidth to be used over the internet.</i>

Focus on the way you can include or create a **subordination** between two sentences and the subordinated conjunctions you can use:

after	now that
although	once
as	since
as	so that
because	unless
before	until
even if	when
though	whenever
if	where
if only	while

Examples

- *Additionally, PHP will prevail for a longer period if only contributes to avoiding legal apps to be rewritten.*
- *I would say ordinary people will eventually need to deal with APIs because an entire social system may have to communicate with thousands of code lines at the speed of light.*
