Let's Start!

Let's take a look at the 80's!

Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.

Give detailed and important information regarding to the history of language programming in different periods of time.

Can Do Statements:

- I can identify key features related to a specific decade in software programming.
- I can explain what imperative languages are.
- I can talk about the so called fifth-generation programming languages.

Ask your partner:

- What important software programming progress do you remember from the 80's?
- Do you know any software programming language? Which one?

Let's Explore!

Jason learns about software programming.

Instructions: Read the text below.

Sarah: Hey, Jason! How's everything?

Jason: Hi, Sarah! Not bad, I guess...

Sarah: Hmm... Why do you say that?

Jason: Well, I have to prepare a presentation about software programming. I found a lot of information but now I don't know how to organize it.

Sarah: Wow! That requires a lot of research, Who are you working with?

Jason: A classmate, but he is busy now.

Sarah: You're in luck! I made a similar presentation last semester. I can help you. So, what kind of information do you need?

Jason: I need to explain the main key features of software programming in the 80's.

Sarah: Let's start! The first key feature was the Analytical Engine.

Jason: What was the Analytical Engine for?

Sarah: It made calculations with Bernoulli numbers. And, it is often considered as the first computer program in the world. On the other hand, the Turing Machine was one of the first machines to store data.

Jason: Wow! Who did you learn with?

Sarah: I had an excellent professor, his name is Mr. Morris. Actually, I learned a lot about imperative languages too.

Jason: What is that for?

Sarah: During that time, a relative consolidation was very important, so programmers had many new ideas. In fact, they found an interesting way to give commands to computers in order to perform particular tasks. It was the imperative language, which basically consisted in describing how a program had to operate.

Jason: Hmm, I see. That's why it's called imperative language.

Sarah: Exactly! Another important key feature you need to know is about the fifth-generation programming languages, sometimes abbreviated as (5GL). Programmers built special programs that could solve problems by themselves, without the need of a programmer. That's why nowadays common users don't have to create algorithms or implement complex tasks in a computer. As you can see, 5GL was the beginning of artificial intelligence.

**Let's Practice!**

The 80's, What a Decade!

Instructions: Select the correct option to correctly complete each sentence.

1. The 80's (brings/ brought/ bring) the consolidation of imperative languages.
2. Languages (grew up / grows up/ grow up) from the paradigms that were created in the previous decade.
3. During the 80's, the existing paradigms (appear / built / build up) the imperative languages up.

**Let's Practice!**

What are programming languages for?

Instructions: Read the sentences. Write the missing word(s) in the blank. Use: Imperative languages, for (2), with.

A: What are _____?

B: They are programming languages consolidated during the 80's.

A: What are they _____?

B: They set commands for the computer to perform.

A: What kinds of programs do they work _____?

B: They work with all kinds of programs.

A: What do you need them _____?

B: To develop new softwares.

Extension Activity

The 80's rock!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Research more on the 80's evolution of language programming.
- Write down important facts about programming languages during the 80's using the simple past.
- Make up some cards with questions about the 80's with the answers on the back.
- Play with your partners.

Self-Assessment

Yes

No

- I talk about the 5GL. ☐ ☐
- I describe what happened with language programming during the 80's. ☐ ☐
- I ask questions about the past of programming. ☐ ☐

Target Words

- **Analytical engine** (noun): a computer model suggested by Charles Babbage in 1837.
e.g. The first key feature was the Analytical Engine.
- **Bernoulli numbers** (noun): rational numbers used to establish algorithmic representations
e.g. It made calculations with Bernoulli numbers.
- **actually** (adverb): in fact, in reality
e.g. Actually, I learned a lot about imperative languages too.
- **build** (verb): to construct or to model something
e.g. Programmers built special programs that could solve problems by themselves, without the need of a programmer.
- **beginning** (noun): the starting point of something
e.g. As you can see 5GL was the beginning of artificial intelligence.

Learning Points

Simple Past Tense: Irregular Verbs

You use the Simple Past Tense to talk about actions that started, happened and finished in the past.

This is the structure to make statements in Simple Past Tense:

Subject + **Verb in past** + Complement

Example:

I studied software programming last year.

She knew a lot about fifth-generation programming languages.

In English, verbs are divided into regular and irregular. For **regular verbs**, you just need to add **-ed** to the end of the verb. While, on the other hand, the **irregular verbs** have a particular conjugation, different from the infinitive form:

In this chart you can find an example of irregular verbs in affirmative, negative and interrogative form:

IRREGULAR VERBS	
Infinitive	Past Simple
To begin	Began
To do	Did
To find	Found
To go	Went
To have	Had
To know	Knew
To teach	Taught

FORM	STRUCTURE	EXAMPLE
Affirmative	S + Verb in past+ Complement	Ronald taught the students how to design a software program.
Negative	S + Auxiliary Did + Not + Verb in base form + Complement.	Ronald didn't teach the students how to design a software program.
Interrogative	Auxiliary Did + S + Verb in base form + Complement +?	Did Ronald teach the students how to design a software program? Yes, he did. No, he didn't.

Learning Points

Examples

- *I found a lot of information but now I don't know how to organize it.*
- *I made a similar presentation last semester.*
- *On the other hand, the Turing Machine was one of the first machines to store data.*
- *I had an excellent professor, his name is Mr. Morris.*

Questions With Prepositions: With and For

When talking in an informal way, you can use **prepositions** in questions.

When a **preposition** becomes the object of a question, these ones are placed at the end of the interrogative sentence. Let's take a look at the structure:

Wh-Question + Auxiliary (If applies) + Verb + Subject + Complement + ?

Examples:

What is an imperative language?

Who works with you?

However, if you need to ask a question with a preposition, the appropriate structure you need to use is:

Wh-Question + Auxiliary (If applies) + Verb + Subject + Complement + Preposition + ?

Example:

*What is an imperative language **for**?*

*Who do you work **with**?*

Notice that the **preposition** must go at the end of the interrogative statement and not at the beginning.

Examples

- *That requires a lot of research, Who are you working with?*
- *Wow! Who did you learn with?*
- *What was the Analytical Engine for?*
- *What is that for?*
